B. Agriculture Branch, Department of Primary Industries Hermitage Research Station, M/S 508, Warwick, Queensland, Australia, 4370

Over 2,200 accessions of *Phaseolus* spp., mainly *vulgaris*, have been screened using a modified Limited Term Inoculation (LTI) test on juvenile plants (Middleton and Redden, 1990). The results of the initial unreplicated screening are provided in Table 1, with the difference in infection levels between low score accessions and susceptible checks (Gallaroy and Actolac) being more consistent in 1984/85 and 1991/92 tests than in 1986. In the latter case infection of checks was not uniform and some of the corresponding accessions screened are more likely to be escapes. Various accessions including erect plant types noted as resistant in field tests (Midnight, A55, Black Valentine, Charleviox, Harvester, NY844, NY9406 and NY9412) were susceptible in LTI tests.

Reference - Middleton and Redden, 1990. Selection of *Sclerotinia sclerotiorum* resistance from a *Phaseolus* spp. germplasm collection. Ann. Rep. BIC. 33:189.

Table 1. Resistant accessions from the primary germplasm screening of seedlings in a limited term inoculation juvenile test for resistance to *Sclerotinia sclerotiorum* 1984-1992, and corresponding check ratings (a, b).

1. Rating Scale

- 1 = no infection
- 2 = small local lesions no vertical spread on stem
- 3 = large local lesions no vertical spread on stem
- 4 = spreading lesions, part girdle of stem
- 5 = spreading lesion, complete girdle of stem
